

ABC Technologies - Technical Troubleshooting and Support Manual

Target Audience: Internal L1 and L2 Technical Support Engineers

Chapter 1: Minimum System Requirements

To ensure optimal performance of the ABC Technologies web and desktop applications, users must meet the following criteria:

- Operating System: Windows 10/11, macOS 12+, or Ubuntu 22.04 LTS.
- Browser: Google Chrome (v100+), Mozilla Firefox (v95+), or Microsoft Edge (v100+).
- RAM: Minimum 4GB, Recommended 8GB.
- Network: Broadband internet connection with at least 5 Mbps upload/download speeds.

Chapter 2: Common Error Codes and Resolutions

Error Code 101: Login Timeouts and Connectivity Drops

Description: The user is repeatedly timed out of their session or fails to authenticate.

Resolution Steps:

1. Verify the ABC server status on the internal dashboard.
2. Advise the user to check their network connection and local firewall settings.
3. Specifically, ensure that port 443 is open for inbound and outbound secure web traffic.
4. If using a VPN, advise the user to whitelist the *.abctechnologies.com domain.

Issue: Application Crashes on File Upload

Description: The desktop or web application unexpectedly closes, freezes, or throws a fatal exception when the user attempts to upload a document, CSV, or media file.

Resolution Steps:

1. File Size Check: Ensure the file size does not exceed the strict 50MB limit per upload.
2. Cache Clearing: The most common cause is corrupted local memory. Instruct the user to clear the application cache by navigating to Settings -> Advanced -> Clear Local Cache.
3. Version Verification: Verify that the user is running the latest software version (Version 2.1 or higher is required for the new upload protocol). If they are on an older version, instruct them to download the latest patch from our website.

Issue: Database Sync Failure (Error 505)

Description: Local changes made in offline mode are not syncing with the cloud database once the connection is restored.

Resolution Steps:

1. Force a manual sync via the "Sync Now" button in the footer.
2. Restart the local background sync client via the Task Manager or Activity Monitor.
3. If the issue persists, the local database file may be corrupted. Instruct the user to perform a clean reinstall of the desktop client.
